

Launch of NEW Browse-A-Map

At our March Open Day, we launched the new version of Browse-A-Map. After months of development and beta testing, the New Browse-A-Map follows with the same concept of ease and affordability. (Other products are available for the Enterprise). New Browse-A-Map is a rich web mapping application based upon Open Source software that allows your users to share geospatial data using nothing more than a standard web browser. Data can be published from a number of standard spatial data sources, enabling true Cloud computing.

The application includes the facilities to quickly pan, re-centre, zoom, find features and retrieve attribute information from data stored in various file formats. Simple theme files, analogous to workspace or project files used in other systems, define and control the mapping available to users.
