

CDR Group has a renewed place on G-Cloud 12, the UK Government's cloud procurement framework

We are very pleased to announce the renewed offering of Spectrum Spatial as a cloud based GIS application via the G-Cloud catalogue. Spectrum Spatial, from Precisely, is a powerful web mapping tool that can be accessed from any device in any location and has an intuitive interface that allows staff to jump straight into spatial data without any training. We already work with a number of public sector organisations and hope that being included in the governments procurement framework will give prospective customers the final vote of confidence they need to invest in CDR.

G-cloud offers public sector organisations the opportunity to purchase their cloud-based software and services from a single catalogue. Buying services through frameworks is faster and cheaper than entering into individual procurement contracts. Buyers and suppliers still need to sign a contract (or 'call-off contract') for each service bought through a framework. G-Cloud 12 is the twelfth iteration of the G-Cloud framework. G-Cloud is open to all public sector bodies including central government, local government, third sector organisations, NHS and other health providers and education.
