

## MapInfo Manager version 1.1 release

Announcing the NEW Version of MapInfo Manager PBBI's spatial data management solution designed to allow organisations to harvest and catalogue their metadata.

### METADATA

Simply put, metadata is data about data.

All Government organisations face continual challenges with discovering data, and then enabling efficient and appropriate access to that data. The high level goal of implementing the INSPIRE directives can be met with MapInfo Manager.

Metadata is not just for those seeking to comply with INSPIRE though - metadata is critical to any business.

You should consider deploying an internal use metadata catalogue for the purposes of improving the overall finding and using of information within your organisation.

MapInfo Manager is part of the solution from PBBI to help our customers meet their INSPIRE requirements. MapInfo Manager is INSPIRE compliant. The metadata catalogue adheres to the Open Geospatial Consortium (OGC) Catalog Services Web (CSW) standard.

MapInfo Manager is a server based catalogue that can be accessed by anyone with a browser but also from within MapInfo, where you can search, interrogate and even open the data into your MapInfo session.

Contact the CDR sales team for more information or a demonstration.
