

Precisely announces version 2019.3 of MapInfo Pro

Precisely strongly encourages customers to stay current by upgrading to the latest release for MapInfo Pro. This is a full install taking MapInfo over to the Precisely family of software products. You do not need a new Serial Number if you already have version 2019. The install routine will uninstall your old version before installing this new one.

Feature Additions in this Release

New Precisely Branding and API endpoints - You will notice a lot of Purple now! The API endpoints that power GeoMap base maps, Geocoding, and Drivetime services within MapInfo Pro have also moved over to Precisely servers. You may need to re-register for these services (using the same credentials). Registering also gives you the access to the Marketplace feature within MapInfo.

NOTE: You will need to update to this latest version of MapInfo Pro v.2019.3 to maintain access to these features.

New LiDAR tools

Surface Analysis - Provides limited triangulation capabilities to a standard MapInfo Pro user - more available in Advanced.

Tree Canopy Analysis - Enables three different methods for canopy cover analysis.

These features allow you to take in numerous LiDAR .las or .laz files and process them. The Surface and Tree Canopy analysis requires the raw LiDAR data, which contains additional readings to just a height value. In our tests with the open data from the Scottish Remote Sensing Portal revealed that those laz files had already been sanitised.

Python Console window - Edit and execute Python code interactively from within MapInfo Pro using the Python console window.

Numerous Enhancements and Product Updates
