

Using MapInfo Pro Advanced to Load Terrain Data and Locate Success With Pitney Bowes Location Intelligence

The new MapInfo Pro Advanced has limitless capabilities to store raster grids with its new MRR format - yes, limitless! Which is pretty handy if you have downloaded the hoards of free data from the Ordnance Survey and Environment Agency. CDR's Director, John Ievers, presented this subject at the recent MapInfo User Group Conference in November 2016 and the GeoData London Showcase event in December. Click to view the video (courtesy of the MapInfo User Group UK) here or on our YouTube channel, where we look at the process of merging ASC files and explaining what the data represents. John also covered this in more detail at a CDR Open Day event but we thought we ought to share this more widely now. The performance is truly awesome - that's the performance of MapInfo we are referring to, rather than John...
